QEO1 – Manuscripts in the QED3 construction

One box per manuscript and its companion outline, or per outline for a future manuscript. Every document occurs in one box only.
Shared chamber setup and final parameter admission belong to QEM1. Arrows identify the results used, under their stated hypotheses.

Proof draft written | Proof draft or integration revision in progress | Proof draft not written

Document units. Each box names its manuscript and companion outline, or the registered outline for a future manuscript. A companion outline is navigation for the same work, not a second proof task. This map follows the current QEM1 proof, which retains the closed-field covariance argument. DPM1 remains an alternative companion; it is not an input to this assembly. Inventory-only documents are not additional prerequisites. RGO1 remains the umbrella for the nine renormalization/response units, not an extra proof box.

Arrows. These are uses of results inside documents, not a requirement to finish one entire paper before starting another. RRM1's early T06 identity feeds TPM1; TPM1's T09 measure feeds RRM1's later response proof. Joined inputs are required together; crossings without a dot do not join. VTM1 owns the finite-periodic moment application. QEM1 admits the common parameters before applying the conditional conclusions.

Status and length, 20 October 2026. Color concerns proof manuscripts; outline status is stated separately. Green records a written draft under its imports, not proof certification. Lengths are measured from the current linked PDFs. All displayed proof units have written drafts. QEM1 imports VTM1 and retains its finite-periodic, parameter, closed-field rotation and tensor arguments. The earlier comprehensive and integration editions are historical.

Series length: 336 pages in the current linked manuscripts. Each manuscript is counted once; outlines, alternative routes and historical editions are excluded.

Difficulty: 1 = routine/setup; 2 = standard techniques; 3 = substantial; 4 = hard; 5 = most demanding. Ratings concern the work inside each document, assuming its imported results. Reassessed against the current proofs; completion does not lower the rating.
